# Japan Grain and Feed Grain and Feed Annual Report 2006

Approved by:

Deanna Ayala U.S. Embassy

Prepared by:

Hisao Fukuda

### **Report Highlights:**

In 2005, the U.S. maintained a sound share in rice and wheat imports. Despite stagnant overall demand for feed grains in Japan, U.S. imports of corn, sorghum and barley combined reached the highest level in the last five years. This was attributed to the recovery of sorghum and barley imports. Although both consumption and imports of grains will remain steady in the short term, demand for rice and wheat is expected to decline over time with changing demographics (aging population). Demand for feed grains will also likely decline in the long term as Japan's livestock population continues to shrink.

Includes PSD Changes: Yes Includes Trade Matrix: No Annual Report Tokyo [JA1] [JA]

### RICE

### **Production Near Normal Year**

As part of its rice policy reforms the Ministry of Agriculture, Forestry and Fisheries (MAFF) has decided to phase out government controls on production by fiscal 2008. As an interim measure, starting 2004, the production control scheme based on the acreage reduction program ended. Instead, a production volume target is set for each prefecture based on demand forecasts by a third party. (Refer to GAIN Report #JA3012, Japan's Proposed Rice Reforms.) For 2005 the national target volume was set at 8,510,000 metric tons (MT).

Despite some damage caused by typhoons in the southern island of Kyushu, overall national production ended with 1% above a normal year yield for the total volume of 9,074,000 MT. This is 564,000 MT greater than the target volume.

### **Downward Rice Consumption Trend Continues**

According to MAFF's latest "Food Balance Sheet", the average annual per capita consumption of rice in 2004 dropped slightly again to 61.5 kilograms from 61.9 kilograms in 2003, which is almost one half of the peak of consumption in 1962 of 118.3 kilograms. The fundamental reason for the decline is westernized and diversified Japanese eating habits, and reversing the downward trend appears difficult in the medium term. Coupled with the demographic situation where Japan's population peaked in 2005, faster than previously forecast, and it is also aging rapidly (one out of four Japanese will be older than 65 by 2015), longer term prospects are also grim.

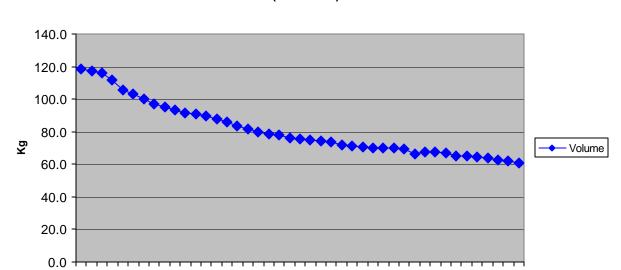

Table 2.

Annual Per Capita Consumption of Rice in Japan (Kilograms)

# Per Capita Consumption of Rice in Japan (1962-2004)

As a result of the reduction in consumption, as well as a decline in the price over the years, household expenditures on rice have been cut by more than half during the last two decades. The average Japanese household now spends about 4 percent of food expenditures on rice.

### **Rice Price Returns to Normal**

Due to the short crop in 2003, wholesale prices in early RY 2003 soared 20 to 50 percent over the previous year (pushing up the retail price in 2004 due to a time lag). Since 2004 wholesale prices have been stable and the retail price returned to the 2002 level.

### U.S. Maintains Near 50% Share of Imports

Currently, for the Japanese fiscal year (JFY) 2005 (April 2005–March 2006), the total U.S. market share remains at the same level as previous years. To date MAFF has held four Simultaneous Buy and Sell (SBS) tenders and eight Ordinary Minimum Access (OMA) tenders. Although the SBS portion (100,000 MT) has been successfully filled, there remains about 80,000 MT under the OMA portion for Japan's commitment to be filled. Therefore, it is expected that another OMA tender will be held within March.

### Early implementation of the Maximum Residue Levels (MRLs) disrupts rice imports

Japan's Ministry of Health, Labor and Welfare (MHLW) published comprehensive revisions to its regulations on allowable pesticide and veterinary drug residues in foods. The final version was published in Japan on November 28, 2005 following official notification to the World Trade Organization (WTO) with a 60-day comment period during the summer of 2005. MHLW announced that it would start to enforce the new MRL standards on May 29, 2006. (The provisional English version of this so-called "positive list" is posted on MHLW's website: http://www.mhlw.go.jp/english/topics/foodsafety/positivelist060228/index.html) Please also refer to GAIN Report JA6004: Summary of Japan's New Positive List System.

At the same time that MHLW was finalizing the new MRL standards, Japan's Ministry of Agriculture, Fisheries, and Forestry (MAFF) separately informed foreign shippers of rice,

wheat, and barley to Japan that it would require imported shipments of these commodities to be in compliance with the new MRL requirements as of December 2005, and not May 29, 2006 as provided in MHLW's proposal. Further, MAFF made other changes involving SBS rice tenders including tender dates, shipment size minimums, and testing protocols in conjunction with enforcement of the new MRL standards in December 2005.

Since these changes were enforced in the middle of the year, rice importers, particularly SBS rice importers who normally contract with suppliers in early spring, experienced difficulty dealing with the new requirements.

Adding to already existing difficulty in getting rice through the SBS system, the new MRL regime is expected to make the SBS business, which is practically the only way for U.S. rice to reach Japanese consumers, even more difficult, further limiting market development efforts and undermining U.S. producers' commitment to produce Japan specific varieties of rice.

### **Trade for Processed Rice Products**

The United States is the third largest exporter of rice flour preparations to Japan after Thailand and China. Japanese users' demand for imported rice flour preparations continues to be strong in 2005 because of a significant price advantage over domestic non-table rice.

In June 2005, the Ministry of Agriculture, Forestry and Fisheries (MAFF) started to release stocks of imported rice into the rice flour sector in an effort to curb the "surge" of imports of rice flour preparations. Although the statistics show that this new release program has not so far had a sizeable impact on the imports of rice flour preparations from the U.S. Post will continue monitoring the movements.

The U.S. share in the imports of rice crackers, pilaf and *sake* (rice wine) remains small due to high labor costs compared to those in countries like Thailand (the largest exporter of rice crackers), China (the largest exporter of pilaf) and the Republic of Korea (the largest exporter of *sake*).

Table 6.

Japanese Imports of Processed Rice Products (MT, except sake)

### **Stocks**

MAFF holds emergency stocks of rice whose appropriate level is currently targeted at 1 million MT. However, this does not include the Minimum Access (MA) rice. The official supply and demand table by MAFF does not include stocks of MA rice. As shown below, stocks of domestic rice have been reduced over the years, and in 2004 went below the targeted level due to a poor crop in 2003. In contrast, stocks of MA rice have been piling up.

Table 7.
Japan's Rice Reserve
(MT)

		Govern	nment	
	Commercial	mmercial Domestic		Total
1995	370,000	1,180,000	0	1,550,000

2005	0	710,000	1,700,000	2,410,000

Source: Food Department/MAFF

This is a major issue for MAFF since the storage cost has become exorbitant. It is also a great concern for the United States because the stocks are virtually all U.S. rice, some of which are few years old. In order not to disrupt the supply and demand for domestic rice, MAFF does not release these stocks. In an effort to reduce the MA stocks, while not greatly disrupting the supply and demand for domestic rice and simultaneously curbing imports of rice flour preparations, MAFF started releasing MA rice stocks for domestic rice flour manufacturers, as mentioned in the previous section.

In a more grand scheme to write the storage cost off of its books, MAFF has developed the idea of creating regional stocks with ASEAN nations plus China and Korea, where each country would contribute a certain amount of stocks (physically held in each nation) to be used for shortage or emergency situations in any of the member nations. The plan for this "East Asia Emergency Rice Reserve (EAERR)" was officially adopted in October 2002 at the ASEAN Plus 3 agriculture ministerial meeting, and currently a pilot program is being conducted. For details, see the EAERR English language website (<a href="http://www.eaerr.org/index.php">http://www.eaerr.org/index.php</a>). However, there appears to be little substantive progress in the multilateral discussion to realize this plan.

### **Minimum Access Commitment Continues into 2006**

As a result of the GOJ's tariffication of rice in JFY 2000, the Minimum Access commitment was reduced to 7.2 percent of total domestic consumption from non-tariffied rate of 8.0 percent. In terms of volume, 7.2 percent is equivalent to 682,000 MT (milled basis). This volume will remain in effect until renegotiated. Japan intends to position rice as a most sensitive item, therefore, to be excluded from the across the board expansion of tariff rate quotas (TRQs) and tariff capping in the WTO Doha Round.

### **Export of Rice under Food Aid**

The Government of Japan sets aside about 200,000 MT of rice under food aid programs on an annual basis. This amount does not show up in the export statistics by the Ministry of Finance, which only records exports of Japanese domestic rice (12,052 MT in the calendar year 2005 which includes a negligible amount of commercial exports). The discrepancy between the total food aid exports and the amount recorded in the official export statistics is considered to be rice imported under the OMA regime and diverted for food aid exports.

# Japan's Food Self-Sufficiency Ratio Again Stays at 40 percent and GOJ Embarks on New "Food Education" Initiative

In 2000 MAFF announced a food self-sufficiency target of 45 percent on a caloric basis by 2010. Japan's self-sufficiency consistently declined for many years but has remained steady at 40 percent since 1998. With the rate in 2003 again stalling at 40 percent, MAFF announced earlier this year that it had given up achieving the target of 45 percent by 2010. But it will continue targeting 45 percent by 2015. In this effort the government, involving the Ministry of Education, has embarked on a "Food Education" campaign by legislating the Basic Food Education Law in 2005 to promote the benefits of a traditional Japanese diet and the concept of "Chisan Chisho (Produce locally and consume locally)". In this context, MAFF developed the Japanese version of the Food Pyramid in 2005. (Please refer to GAIN Report JA5057: Japan's Food Education Initiatives.)

### Japan's Self-Sufficiency Ratio

### Marketing

As long as the current import and stock regime remains, there will always be two major constraints to marketing U.S. rice in Japan; 1) the difficulty of securing a steady supply at a stable price through the SBS system and 2) MAFF's reluctance to release stocks of OMA rice into the market. There are over a million metric tons of OMA rice stored in the government-commissioned warehouses. Without a transparent and regular release of OMA rice stocks, potential users in the food service and processing sectors cannot be developed.

Despite a highly restrictive marketing environment, the USA Rice Federation (USARF) continues to conduct a diligent marketing program. The development of the "USA Rice Shop Network" launched in 2002, where individually owned rice shops in major metropolitan areas are selling U.S. rice all year around, has proven that once U.S. rice is available on a consistent basis, Japanese consumers buy it repeatedly even at similar prices to Japanese domestic rice (the price of U.S. rice is significantly raised through the SBS system). In 2006, the USARF will be embarking on food service and Home Meal Replacement promotions by holding a creative U.S. rice *sushi* recipe contest, entitled "California-Style Sushi Master Contest," targeting professional chefs and recipe creators.

### **WHEAT**

### Production in 2005 up 2 Percent

The total planted area for wheat in 2005 increased slightly from 212,600 hectares in 2004 to 213,500 hectares in 2005. Due to a higher yield, the overall production increased by two percent from 859,900 MT in 2004 to 877,400 MT in 2005. The major production area of Hokkaido, however, saw a drop in production, due to a lower yield caused by dry weather after pollination, from 558,200 MT in 2004 to 540,100 MT in 2005.

Table 10.

Japan's Wheat Production

	Planted Area	Production	Yield
	(hectares)	(MT)	(MT/ha)
2001	196,900	699,900	3.55
2002	206,900	827,800	4.00
2003	212,200	855,200	4.03
2004	212,600	859,900	4.04
2005	213,500	877,400	4.11

### **New Subsidy Scheme Announced**

In October 2005, MAFF announced the outline of a new farm subsidy program that departs from the current commodity-specific support given to practically all farmers and calls for direct payments targeting larger scale farmers. Following drafting of the necessary legislation in JFY 2006, the new scheme is scheduled to commence in JFY 2007. (Please refer to GAIN report JA5068: Japan Embarks on a Drastic Change in its Farm Subsidy Scheme.)

The core feature of the direct payment is to fill the cost/price gap between specific domestic farm products and imports. Wheat (as well as barley) is one of the most important commodities targeted in the new scheme. In the announced plan, farmers who meet certain criteria, such as cultivating more than a certain acreage, will receive a set amount of direct payments. For wheat, the tentative amount discussed is 40,200 yen per 10 ares (approximately 1,377 U.S. Dollars per acre).

While MAFF's goal is to encourage the upward trend in wheat production through the use of this direct payment, it is difficult to forecast at this point whether the new program will be successful or not. An expansion of domestic wheat production will ultimately depend on whether or not Japanese producers will be able to produce wheat that is acceptable to endusers in quality which is currently evaluated by Japanese flour millers as much inferior to imported wheat.

In the interim, Post projects that the current level of production is near the ceiling of what the market can absorb with the current level of price support. In 2006, Post forecasts that the planted acreage will further increase but production may decline slightly if the yield returns to a normal year level.

### **Wheat Consumption Stays Flat**

Wheat consumption had been gradually increasing as consumers shifted from rice to processed wheat products such as bread and pasta. However, consumption has been flat

since 2000, stemming from Japan's depressed economy. In 2003/04, wheat consumption increased slightly as the overall downward trend was temporarily offset due to the higher price of rice caused by a short crop. As projected last year, consumption in 2004/05 went back to the 2001/02 level. In the long term, considering the growing size of the elderly population, who tend to eat more traditional foods, it is expected that consumption will continue to decline slowly.

Table 11.
Per Capita Consumption of Wheat in Japan (Kilograms)

31.7	32.4	32.2	32.4	32.6	32.1	31.9	32.6	32.3	32.0

Source: MAFF
\* Ag Office estimate

### **Utilization Patterns**

In 2004 production of wheat based products stayed at the level in 2003, following a slight increase in 2003 due to increased production in anticipation of increased demand in 2004, expected from a poor rice crop. Wheat consumption did increase slightly in 2003/04 as mentioned in the previous section, but this was a temporary trend. Domestic production of selected wheat products is estimated to be flat or decline slightly in coming years as Japan's demography changes.

As a more visible threat, flour millers continue having to compete with increasing imports of premixes (flour preparations) and semi-finished or finished products such as frozen dough (see Table 15 in the following trade section.). As a side note, MAFF is aggressively promoting use of rice flours in bread and other products in an effort to develop new demand for over-produced rice. Post expects the impact of this on wheat flour consumption on the macro basis is minimal.

Table 12.

Japanese Production of Selected Wheat Products (1,000 MT)

	2001	2002	2003	2004	2005*

### **Government Resale Price for 2006 Lowered Again**

MAFF controls both producer and resale prices of both domestic and imported wheat. MAFF buys imported wheat at international prices and sells it to domestic flour millers at higher prices. As shown in Table 13 below, the ratio in recent years has been consistent at 2.0, which means MAFF sells imported wheat at twice the purchase price. The table shows that

the 2006 resale price for U.S. Western White was lowered by 0.8 percent from 2005. On the other hand, MAFF buys domestic wheat at a high price and sells it to domestic flour millers at a significantly lower price, lower than imported wheat so that the lower quality domestic wheat will be accepted. Revenues from transactions for imported wheat are used to help cover the cost difference between the purchase and resale of domestic wheat. This is referred to as the "Cost Pool System".

Although this current state trading regime will likely be maintained in the foreseeable future, along with the introduction of a new direct payment scheme explained in the previous section, MAFF plans to introduce the Simultaneous Buy and Sell (SBS) system, as done for rice and feed wheat/barley. The idea is to separate certain specialty types/varieties like durum from the state purchase and set them aside for the SBS tenders where flour millers would be able to have an opportunity to directly purchase the product they like directly from suppliers they choose. The decision to actually introduce the SBS system should be made in early JFY 2006, followed by discussion of details, such as the types of wheat, quantities, and tender methods. If everything progresses without stalling, it can be implemented as early as JFY 2007. However, the total amount set aside for the SBS tender is expected to be very limited.

Table 13.

GOJ Purchase and Resale Price of U.S. Wheat (Yen per MT)

	Average CIF	Resale

Source: MAFF and Ministry of Finance The price includes 5% consumption tax.

### Wheat Imports Stay Strong in 2005

Total imports of wheat in calendar year (CY) 2005 stayed strong at 5,472,347 MT. This is in line with the average over the last several years of 5.5 million MT. Over the medium term, however, increased imports of processed products will continue to reduce import demand for wheat. The U.S. share of total imports in 2005 was maintained at the previous year's level of 56-57 percent.

Table 14.

Japanese Wheat Imports by Source
(MT)

Year	U.S.	Share	Canada	Australia	TOTAL
CY 2003	2,983,496	56.9%	1,069,828	1,167,656	5,246,121

Source: Ministry of Finance

MAFF allows flour millers to import wheat outside of MAFF's control as long as they export an equivalent amount of wheat flour. This so-called "free wheat" is imported at world prices (less than half of MAFF's resale price) and is thus very profitable. This system also provides millers with an export market for their lower quality flour, which otherwise would have little value in the domestic market.

Table 16.

Japanese Exports of Wheat Flour by Destination (MT)

Destination	CY 2003	CY 2004	CY 2005
Hong Kong	195,051	189,882	186,806

Total	318,700	304,413	289,910

Source: Ministry of Finance

### **Stocks**

Japan has held emergency stocks of wheat at the level equivalent to 2.6 months' worth of demand. Due to the shortened time necessary to obtain alternative supplies in case of an emergency, the stocks have been reduced to 2.3 months' worth as of the end JFY 2005. Although the actual stock figures are not disclosed, it is calculated to be around 1.06 million metric tons.

### Feed Wheat Imports through SBS System

In 1999, MAFF introduced the Simultaneous Buy and Sell (SBS) system for imported wheat and barley for feed use. During JFY 2005, MAFF conducted five SBS tenders, through which 89,935 MT of imported wheat was contracted. In 2002 and 2003 Japan purchased a small amount of Ukrainian wheat but discontinued that in 2004. Although it continues to purchase a small amount of Chinese wheat, in the near future Post does not see a significant advance by these low cost producers.

Table 17.

SBS Imports of Feed Wheat and Barley (MT)

	Wheat	Barley

5th	18,520	220,000
Total	89,935	1,000,000

Source: MAFF

### Marketing

The US Wheat Associates (USWA) has been a diligent and effective liaison between the Japanese trade and U.S. industry, conducting activities to maintain and enhance trade relationships. In order to further develop market potential for U.S. wheat, it has embarked on cultivating users of U.S. durum wheat. A reverse trade mission was conducted in 2004 for this particular purpose, and received a good reaction from the participants. The second mission was held in 2005.

### CORN

### **Production**

Corn production is negligible in Japan.

### Overall Corn Demand Stable; Stagnant Feed Demand Offset by Increased Food Use

It was logically expected that the prolonged import ban of U.S. beef and beef products would lead to some build up of domestic cattle herd to take advantage of the lack of imports. This did not happen since the lack of U.S. beef imports was filled by imports from other countries, mostly Australia. Since the tight supply pushed up beef prices, some replacement demand has gone to chicken and pork, but again, resulted in increased imports of chicken and pork, not increased domestic production.

With the outbreak of avian influenza (AI) in Japan, first detected in February 2004, continuing, domestic poultry producers have become hesitant to build up the broiler/layer population. Therefore, overall feed demand was stagnant in 2005. While there is no change in the overall declining trend in Japan's livestock population over the years, with so many unknowns in animal health/quarantine issues at this point, it is extremely difficult to make any long-term forecast.

Table 18.

### **Utilization Patterns**

Roughly 70 percent of total demand for corn in Japan comes from the feed sector, 22 percent from starch manufacturers, and 8 percent from other food-use sectors including manufacturers of corn grits (used as a fermentation ingredient in liquors), cornflakes and confections.

Corn is the major ingredient used in compound and mixed feed. The ingredient ratio is adjusted from year-to-year, depending on prices of various grains, but the corn ratio has been fairly constant at 48–50 percent in recent years. Of the total demand for corn, about 44-45 percent comes from the poultry sector.

# Production of Feed Likely to Stay Flat in 2005/06 while Strong Food Demand Expected to Continue

Following a temporary small increase in 2002/03 due to the post-BSE cattle feed demand (Japan's first BSE was detected in September 2001.) and increase in swine population, the total production of compound feed has since returned to a declining path. In JFY 2005/06, Post projects that feed demand will stay flat or decline slightly.

On the other hand, primarily due to a strong beverage demand for corn sweeteners, a robust demand for food corn is expected to continue. In the long term, the downward trend in livestock population appears irreversible (see Table 18.) and feed demand in Japan is expected to decline slowly but surely. The future of corn demand in Japan relies heavily on demand enhancement and development in the non-feed sector. Practically all food corn users in Japan still require non-biotech and therefore U.S. suppliers are expected to use the IP system to assure their customers this requirement is met.

Table 21.

### **Prices**

The cost of imported corn jumped significantly in 2004, reflecting higher export prices and sky rocketed trans-Pacific freight rates. The cost in 2005 declined but still remains at a high level.

### Trade Returns to U.S. as Starlink Issue Diminishes, but Aflatoxin Concern Arises

Feed corn imports in 2005 were down due to the stagnant demand situation described in the previous section.

Food corn imports increased again in CY 2005 due to an aggregate demand increase in the beverage sector, particularly for high fructose corn syrup (HFCS) used in low alcoholic drinks like *happoshu* (light beer) and other alcoholic beverages, reflecting increased popularity for these drinks in addition to a continued strong demand for soft drinks. Since China continues to struggle in gathering exportable supplies, the United States share in the food corn imports increased. Supporting factors include StarLink monitoring showing zero detection continually and diligent efforts by the U.S. industry to educate Japanese users about its rigorous Identity Preserved (IP) handling program.

Therefore, the increase in food corn imports offset the decline in feed corn imports for CY 2005. Looking at the marketing year (MY) imports (October 2004 – September 2005) total corn imports declined 1.8 percent from the previous year, but imports from the United States increased by 1.3 percent.

While the StarLink issue is diminishing, detection of aflatoxin in U.S. food corn has caused serious concern among the Japanese trade. Since December 21, 2005 to date, 20 lots have been detected with above tolerance level (10 ppb) for aflatoxin B1. Post has been coordinating closely with the U.S. Grains Council and communicating with the Japanese trade organizations in order to address their concerns.

### Stocks

Japan holds emergency stocks of essential feed grains, i.e. corn, sorghum, and barley. For over a decade until 2003, the stock level was set at approximately 630,000-670,000 MT, 130,000-170,000 MT and 390,000-400,000 MT respectively for the total of three grains fixed at 1,200,000 MT. In the scheme of regulatory reforms and downsizing of government expenditures, since 2003 the stock size has been reduced to 1,000,000 MT in 2003 and 950,000 MT in 2004. It was maintained at the same level in 2005. The breakdown is 535,000 MT for corn, 65,000 MT for sorghum and 350,000 MT for barley.

### **Government Stocks Released to Ease Impact of Hurricane Katrina**

Shortly following the hurricane, MAFF announced that it would release the government stocks of corn/sorghum and barley on loan (i.e. recipients are required to return the same amount to the government at a later date). The set-aside volume was 300,000 MT for corn and sorghum combined and 100,000 MT for barley. As a result, although no request for barley was made, about half of the set-aside amount of corn/sorghum was released (145,600 MT to be exact). The impact of this devastating hurricane on the grain trade was greatly alleviated by tremendous efforts by all parties involved.

### Marketing

With traditional markets for coarse grains expected to decline as Japan's domestic livestock production contracts, the U.S. Grains Council (USGC) continues to explore markets for "new use" products featuring Value Enhanced Grains (VEG) such as high oil corn. It held a symposium featuring experts from the U.S. in February 2005 in Tokyo and Osaka gathering over 100 key wet and dry millers, food manufacturers and traders. This was followed by a reverse trade mission in September 2005 where Japanese corn processors visited IP handling facilities and farms in the U.S. Promoting VEG aims at increasing the total monetary value of coarse grains exported to Japan, offsetting the forecast decline in export volume with a long-term perspective.

In addition, USGC continues to play a pivotal role in maintaining and enhancing the Japanese trade confidence in U.S. corn, e.g. IP handling system. Looking further into the future, USGC is also educating Japanese trade about the use of corn in ethanol production as well as in biomaterials.

### **SORGHUM**

### **Production**

Like corn, production of sorghum is negligible in Japan.

### Consumption

Sorghum is a substitute for corn in the production of compound and mixed feeds. Therefore, the utilization rate for sorghum in these feeds fluctuates depending on its relative price to corn and other ingredients. In the last few years, the ratio had been declining due to an increase in its price. In JFY 2004, the most recent year with confirmed statistics, the sorghum utilization ratio went down to 5.8 percent from 7.6 percent in 2001, is and expected to stay flat or slightly decline again in 2005/06 since the import price is still not advantageous over corn.

### **Prices**

CIF prices for sorghum continued to rise until 2004 and went down in 2005. The U.S. sorghum price was attractive over Australia, the second largest supplier to Japan after the U.S.

Table 24.

Average CIF Price of Sorghum for Feed by Origin (\$US per MT)

	CY 2003	CY 2004	CY 2005	%05/04
United States	143.7	168.5	155.1	92.0%

Australia	150.4	190.7	173.6	91.0%
China	143.7	162.8	NA	NA

Source: Ministry of Finance

### **Trade**

The U.S. is the largest supplier of sorghum to Japan. Since sorghum is mainly a substitute for corn, its potential growth in imports largely depends on its relative price to corn, which did not change significantly in 2004 and 2005. Overall imports, thus, stayed flat in 2005. Due to absence of competition with Australia (having little exportable supply) and China (where the price of sorghum soared due to domestic demand), U.S. imports dominated in 2005, with the share exceeding 80 percent. This situation is expected to continue into 2006.

Table 25.

Source: Ministry of Finance

### Stocks

As written in the previous CORN section, Japan holds emergency stocks of essential feed grains, i.e. corn, sorghum, and barley. The stocks of sorghum had been kept at 130,000-170,000 MT over a decade until 2003. With the policy to reduce the overall feed grain stocks, sorghum stocks were reduced to 75,000 MT in 2003, to 66,000 MT in 2004, and 65,000 MT in 2005.

### Marketing

The U.S. Grains Council (USGC) has been conducting a trade education program to promote sorghum, particularly for food use, in Japan. In this effort USGC organized a trade mission in July 2005 for U.S. producers to learn about the Japanese market needs firsthand.

### **BARLEY**

### **Production**

According to MAFF's survey for the 2005 barley crop, although the yield was slightly better than 2004, production declined by 5.7 percent due to a decline in the crop area by 8.4 percent. Since over 90 percent of the total barley production area is on converted rice paddy land, production of barley is strongly affected by the rice policy and its reform. Therefore, this year's reduction in the crop area indicates more rice farmers chose to produce rice instead of barley. (Note the increase in rice planted area in *Table 1* in the RICE section.) The new direct payment program, explained in the WHEAT section, will also target barley. Once the new scheme is finalized and implemented in JFY 2007, it may encourage permanent production of barley, not merely as an alternative crop to rice. It is difficult to make medium term projections without evaluating the impact of this new subsidy program, once implemented, as well as the success of the rice policy reform to be completed by JFY 2008. In the interim, Post does not expect a major change in either in crop area or production volume in 2006/07, given a normal yield.

Table 26.
Crop Area and Production of Barley in Japan

	Crop Area	Production
	(hectares)	(MT)
2001	60,540	206,400
2002	64,490	217,200
2003	63,600	198,500

2004	59,860	195,600
2005	54,840	184,500

Source: MAFF

### Consumption

In Japan, over 80 percent of the total domestic consumption of barley is used for compound and mixed feed production for the cattle sector (beef and dairy). Barley is particularly important in feeding beef cattle because it produces high quality beef with the white marbling Japanese consumers favor. The largest non-feed uses are for the production of *shochu*, a traditionally distilled liquor, and beer. Other uses include *miso* (soybean paste) and barley tea. Consumption of barley has been constant at around 1.65 million MT since 2001, and there is no indication that it will change significantly in the near future.

### **Prices**

After reaching record high levels in 1996, the average CIF price of barley declined until 1999, rebounded in 2000 and has been hovering at high levels since. The U.S. CIF price dropped in 2004 but rebounded in 2005.

Table 27.

Source: Ministry of Finance

### Trade

Along with rice and wheat, barley imports are controlled by MAFF as a "Staple Food". In fact, in the Japanese language wheat and barley are both called "mugi" where wheat is "ko-mugi" or small-mugi and barley is "oh-mugi" or big-mugi. Even though the import system for barley mimics the free market principle fairly closely, MAFF is hesitant to remove barley from the state system because it is a strategic alternative crop under the rice crop diversion program (see GAIN Report, #JA3058, Grain and Feed – Japan's Barley Policy, 8/22/03.)

Due to tight supplies and higher prices from traditional suppliers, Japan imported a small amount of barley from the Ukraine in 2002 for the first time in many years. In 2003 purchases from the Ukraine increased and Germany also emerged as a supplier. The United States also enjoyed a large increase in exports to Japan in 2003. However, because of a decline in production in Eastern Europe and a bumper crop in Australia, imports in 2004 returned to traditional supply sources, and imports from the United States also took a drop, attributed also to shrunk exportable supplies in the United State due to a bullish demand from the U.S. domestic wet-milling sector.

In 2005, contrary to a pessimistic earlier projection by Post, imports from the U.S. almost doubled. Although this may appear to be a dramatic increase, on the Marketing Year (MY) basis (October 2004 – September 2005), the increase rate is 56 percent. This is largely due

to a recovery in U.S. exportable supplies, and not related to major changes in external factors like competitors' supply capabilities. For 2006, there will be no significant change in the aggregate demand for imported barley, i.e. around 1.4 million MT.

### SBS Tender for Feed Barley since 1999

As noted in the WHEAT Section of this report, MAFF introduced the Simultaneous Buy and Sell (SBS) system for barley for feed in JFY 1999. During JFY 1999, 359,940 MT of feed barley was contracted under three tenders. The amount had been raised every year to 850,000 MT in JFY 2002, remained at that level for 2003, and was raised in JFY 2004 to 900,000 MT, then to 1,000,000 MT in 2005 under five tenders.

Table 29.

SBS Imports of Feed Wheat and Barley (MT)

	Wheat	Barley
1st tender	17,720	200,000
2 <sup>nd</sup>	18,710	190,000
3 <sup>rd</sup>	16,280	190,000
4 <sup>th</sup>	18,705	200,000
5 <sup>th</sup>	18,520	220,000

Total	89,935	1,000,000
-------	--------	-----------

Source: MAFF

### **Stocks**

As written in the previous CORN and SORGHUM sections, Japan holds emergency stocks of essential feed grains, i.e. corn, sorghum, and barley. The stocks of barley had been kept at 390,000-400,000 MT over a decade until 2003. With the policy to reduce the overall feed grain stocks, barley stocks were reduced to 350,000 MT in 2003 and kept at the same level in 2004 and 2005.

### Marketing

As the majority of barley is purchased through the SBS tenders, the U.S. Grains Council organized a reverse trade mission in August 2005 for Japanese buyers to obtain the latest information on barley production in the U.S.

### **RYE**

### Production

Production of rye is minimal in Japan.

### Consumption

Rye is almost exclusively used for feed in Japan. The main uses of rye are almost exclusively for cattle feed and swine feed. Since there is practically no domestic production, annual rye consumption and imports are directly linked with domestic cattle and swine production. In 2004, the latest statistics available (Table 20), total rye utilization in feed was 259,442 MT: 73,875 MT for dairy cattle; 43,950 for beef cattle; and 137,966 MT for swine.

### **Prices**

As shown below, U.S. rye is significantly less price competitive than that of Germany or Canada, the two major suppliers for Japan. Although the U.S. price dropped significantly in 2005, it is still more than twice as expensive as Canada or Germany.

Table 30.

Average CIF Price of Rye by Origin (\$US per MT)

	CY 2003	CY 2004	CY 2005	%05/04
United States	612.9	620.5	344.3	55.5%
Canada	156.7	196.6	160.8	81.8%
Germany	105.0	131.5	143.4	109.0%

Source: Ministry of Finance

### Trade

Germany dominates rye exports to the Japanese market because of its price competitiveness. Imports in CY 2005 declined slightly due to stagnant cattle and swine feed demand. As this situation continues into 2006, Post projects that imports in 2006 will remain

at the level between 280,000-300,000 MT. In the medium term, a continued decline is expected as Japan's cattle and swine populations will likely shrink.

Table 31.
Imports of Rye by Origin
(MT)

	CY 2003	CY 2004	CY 2005
United States	392	251	879
Canada	6,282	98,984	12,272
Germany	399,167	157,239	268,531
Other	24	31,804	0
Total	405,865	288,278	281,682

Source: Ministry of Finance

### **Stocks**

Unlike corn, sorghum and barley, Japan does not hold strategic emergency stocks of rye. Commercial stocks are estimated to be around 15,000 MT.

### **BEANS**

### **Production**

Small red beans (Azuki) and kidney beans account for almost all of Japan's dry bean production. Production volume of small red beans in 2005 declined 12.8 percent from a good harvest in 2004. This was due to a decline in the planted area coupled with a slightly dry weather condition in the major production areas of Hokkaido. The production volume for kidney beans also declined 5.9 percent with the production area shrinking by 5.1 percent.

Table 32.

Crop Area and Production of Major Beans in Japan

	Small Red (A	Azuki) Beans	Kidney Beans		
	Area (Hectares)	Production (MT)	Area (Hectares)	Production (MT)	
2001	45,700	70,800	13,300	23,800	
2002	42,000	65,900	14,700	34,000	
2003	42,000	58,800	12,800	23,000	
2004	42,600	90,500	11,800	27,300	
2005	38,300	78,900	11,200	25,700	

Source: MAFF

### Consumption

Japan's annual bean consumption had been fairly constant at around 230,000 metric tons. However, because the stagnant domestic economy has negatively affected the demand for traditional Japanese confections (a major user of beans), bean consumption has been declining to 200,000 – 220,000 MT level in the last few years.

### Table 33.

### Trade

Japan's imports of small red beans and kidney beans combined decreased from 51,499 MT in 2004 to 37,296 MT in 2005. This was due to a recovered production of Japanese beans in 2004 and increasing imports of finished and semi-finished sweet bean paste. Post projects imports in 2006 will be flat or may recover slightly reflecting the decline in domestic production in 2005.

Table 34.

### **Policy**

With implementation of the Uruguay Round Agreement in JFY 1995, the quota system for bean imports was replaced by a low tariff rate quota system. A market access volume of 120,000 MT per annum is maintained with 10 percent duty applied within the current access volume. With a shrinking demand, caused mainly by increasing imports of finished/semi-finished products, particularly sweet bean paste, the quota has not been fully utilized.
